

Complete Setup Guide for "Brainly" Chatbot

Step 1 — Register the App in Azure

Go to <https://portal.azure.com/#home> (or search "Microsoft Entra ID" in portal.azure.com).

Navigate to **App registrations** → click **+ New registration**.

Fill in:

- **Name:** Brainly
- **Supported account types:** Accounts in this organizational directory only (Single tenant)
- **Redirect URI:** Leave blank

Click **Register**.

On the overview page, immediately copy and save these two values:

- **Application (client) ID** → this becomes your BOT_APP_ID / CLIENT_ID
- **Directory (tenant) ID** → this is your TENANT_ID

Step 2 — Create a Client Secret (Critical Step)

In your Brainly app registration, go to the left menu → **Certificates & secrets** → **Client secrets** tab → click **+ New client secret**.

Fill in:

- **Description:** brainly-secret
- **Expires:** 24 months (or your preference)

Click **Add**.

Immediately copy the "Value" field — this is your real client secret. Do NOT copy the "Secret ID" — that's a different thing entirely. Once you navigate away, you can never see this value again.

Step 3 — Add API Permissions

You need two sets of permissions for two purposes.

For Microsoft Graph (user presence fetching):

Left menu → **API permissions** → **+ Add a permission** → **Microsoft Graph** → **Application permissions**:

- Search and add **Presence.Read.All**
- Search and add **User.Read.All**

For the bot itself:

Also ensure **User.Read** (Delegated) is present — it's usually added by default.

After adding all permissions, click **Grant admin consent for [YourTenant]**. All permissions should show a green "Granted" status.

Step 3.5 — Create an Azure Bot Resource

Go to **Resource Groups** → click **Create** → search for **Azure Bot** → select it → click **Create**.

Fill the form:

- **Bot handle:** Brainly
- **Subscription:** Your active Azure subscription
- **Resource group:** Choose your existing group
- **Data residency/region:** Choose your preferred region (e.g., Central India)
- **Pricing tier:** Free (F0) — gives you 10K free messages/month
- **Type of App / Microsoft App ID:** Single Tenant
- **Choose:** Use existing app registration
- **App ID:** Paste the Application (client) ID from Step 1
- **Tenant ID:** Paste your Tenant ID
- If asked for a client secret, paste the **Value** from Step 2

Click **Review + create** → **Create**.

Step 4 — Configure the Azure Bot

Open your new Brainly bot resource → left menu → **Settings** → **Configuration**.

Verify:

- **Microsoft App ID** matches your App Registration client ID
- **App type** is Single Tenant

- **App Tenant ID** matches your organization's tenant ID

Set the **Messaging endpoint** to: `https://<your-ngrok-or-production-URL>/api/bot/messages`

Click **Apply / Save**.

Step 5 — Enable Microsoft Teams Channel

In the bot resource, go to left menu → **Settings** → **Channels**.

Click **Microsoft Teams** → Enable/Add it. Once connected, it should appear in the channel list as "Healthy."

Step 6 — Update Your .env File

Your backend needs these credentials:

`BOT_APP_ID=<your Application (client) ID>`

`BOT_APP_PASSWORD=<your client secret VALUE>`

`BOT_APP_TYPE=SingleTenant`

`BOT_TENANT_ID=<your organization tenant ID>`

`GRAPH_CLIENT_ID=<your Application (client) ID>`

`GRAPH_CLIENT_SECRET=<your client secret VALUE>`

`GRAPH_TENANT_ID=<your tenant ID>`

Restart your server and ngrok (if testing locally).

Step 7 — Install the Bot in Teams via Developer Portal

Go to <https://dev.teams.microsoft.com> → left side → **Apps** → **Create a new app**.

App name: Brainly → click **Add**.

Fill Basic Information:

- **Short name:** Brainly
- **Full name:** Brainly Chatbot

- **Short description:** AI chatbot supporting text, images, GIF, audio, and video sharing
- **Full description:** Brainly is an intelligent chatbot for Microsoft Teams that supports text messages, image sharing, GIF sharing, audio messages, and video sharing.
- **Developer name:** Your name
- **Website:** Your organization's website
- **Privacy policy / Terms of use:** Your relevant URLs

Add icons:

- Color icon: 192×192 PNG
- Outline icon: 32×32 PNG (Use defaults for first deployment if you don't have custom icons yet.)

Step 8 — Configure Bot in Developer Portal

Go to **App features** (or "Capabilities") → **Bot**.

It will ask for a **Bot ID** — paste your **Azure Bot Microsoft App ID** (the same BOT_APP_ID from your .env). Do NOT use the Teams app package ID that Developer Portal auto-generates.

Choose scopes: Select **Personal** (for 1:1 chat — easiest to test and best for individual interactions).

Step 9 — Regarding Media Support (Text, Image, GIF, Audio, Video)

The documents cover registration and deployment, but to support all the media types you want, your backend code needs to handle these attachment types. Microsoft Teams Bot Framework supports:

- **Text** — handled by default
- **Images** — users can send images; your bot receives them as attachments with a content URL
- **GIFs** — sent as image attachments or via Adaptive Cards
- **Audio** — received as file attachments; your bot needs to download and process them

- **Video** — same as audio, received as file attachments

Your messaging endpoint (/api/bot/messages) needs logic to detect activity.attachments, check the contentType (e.g., image/png, image/gif, audio/mp4, video/mp4), and handle each accordingly. For sending media back, use Adaptive Cards or Hero Cards with media URLs.

Step 10 — Validate and Publish

Back in Developer Portal → **Test and distribute** → click **Validate**. Fix any errors.

Once validation passes → go to **Publish** → click **Publish to Organization**.

Your Teams Admin needs to approve the app. After approval, the bot appears in Teams. You can click **Preview in Teams** to test it immediately.

Send "Hi" to Brainly in Teams — you should get a reply.
